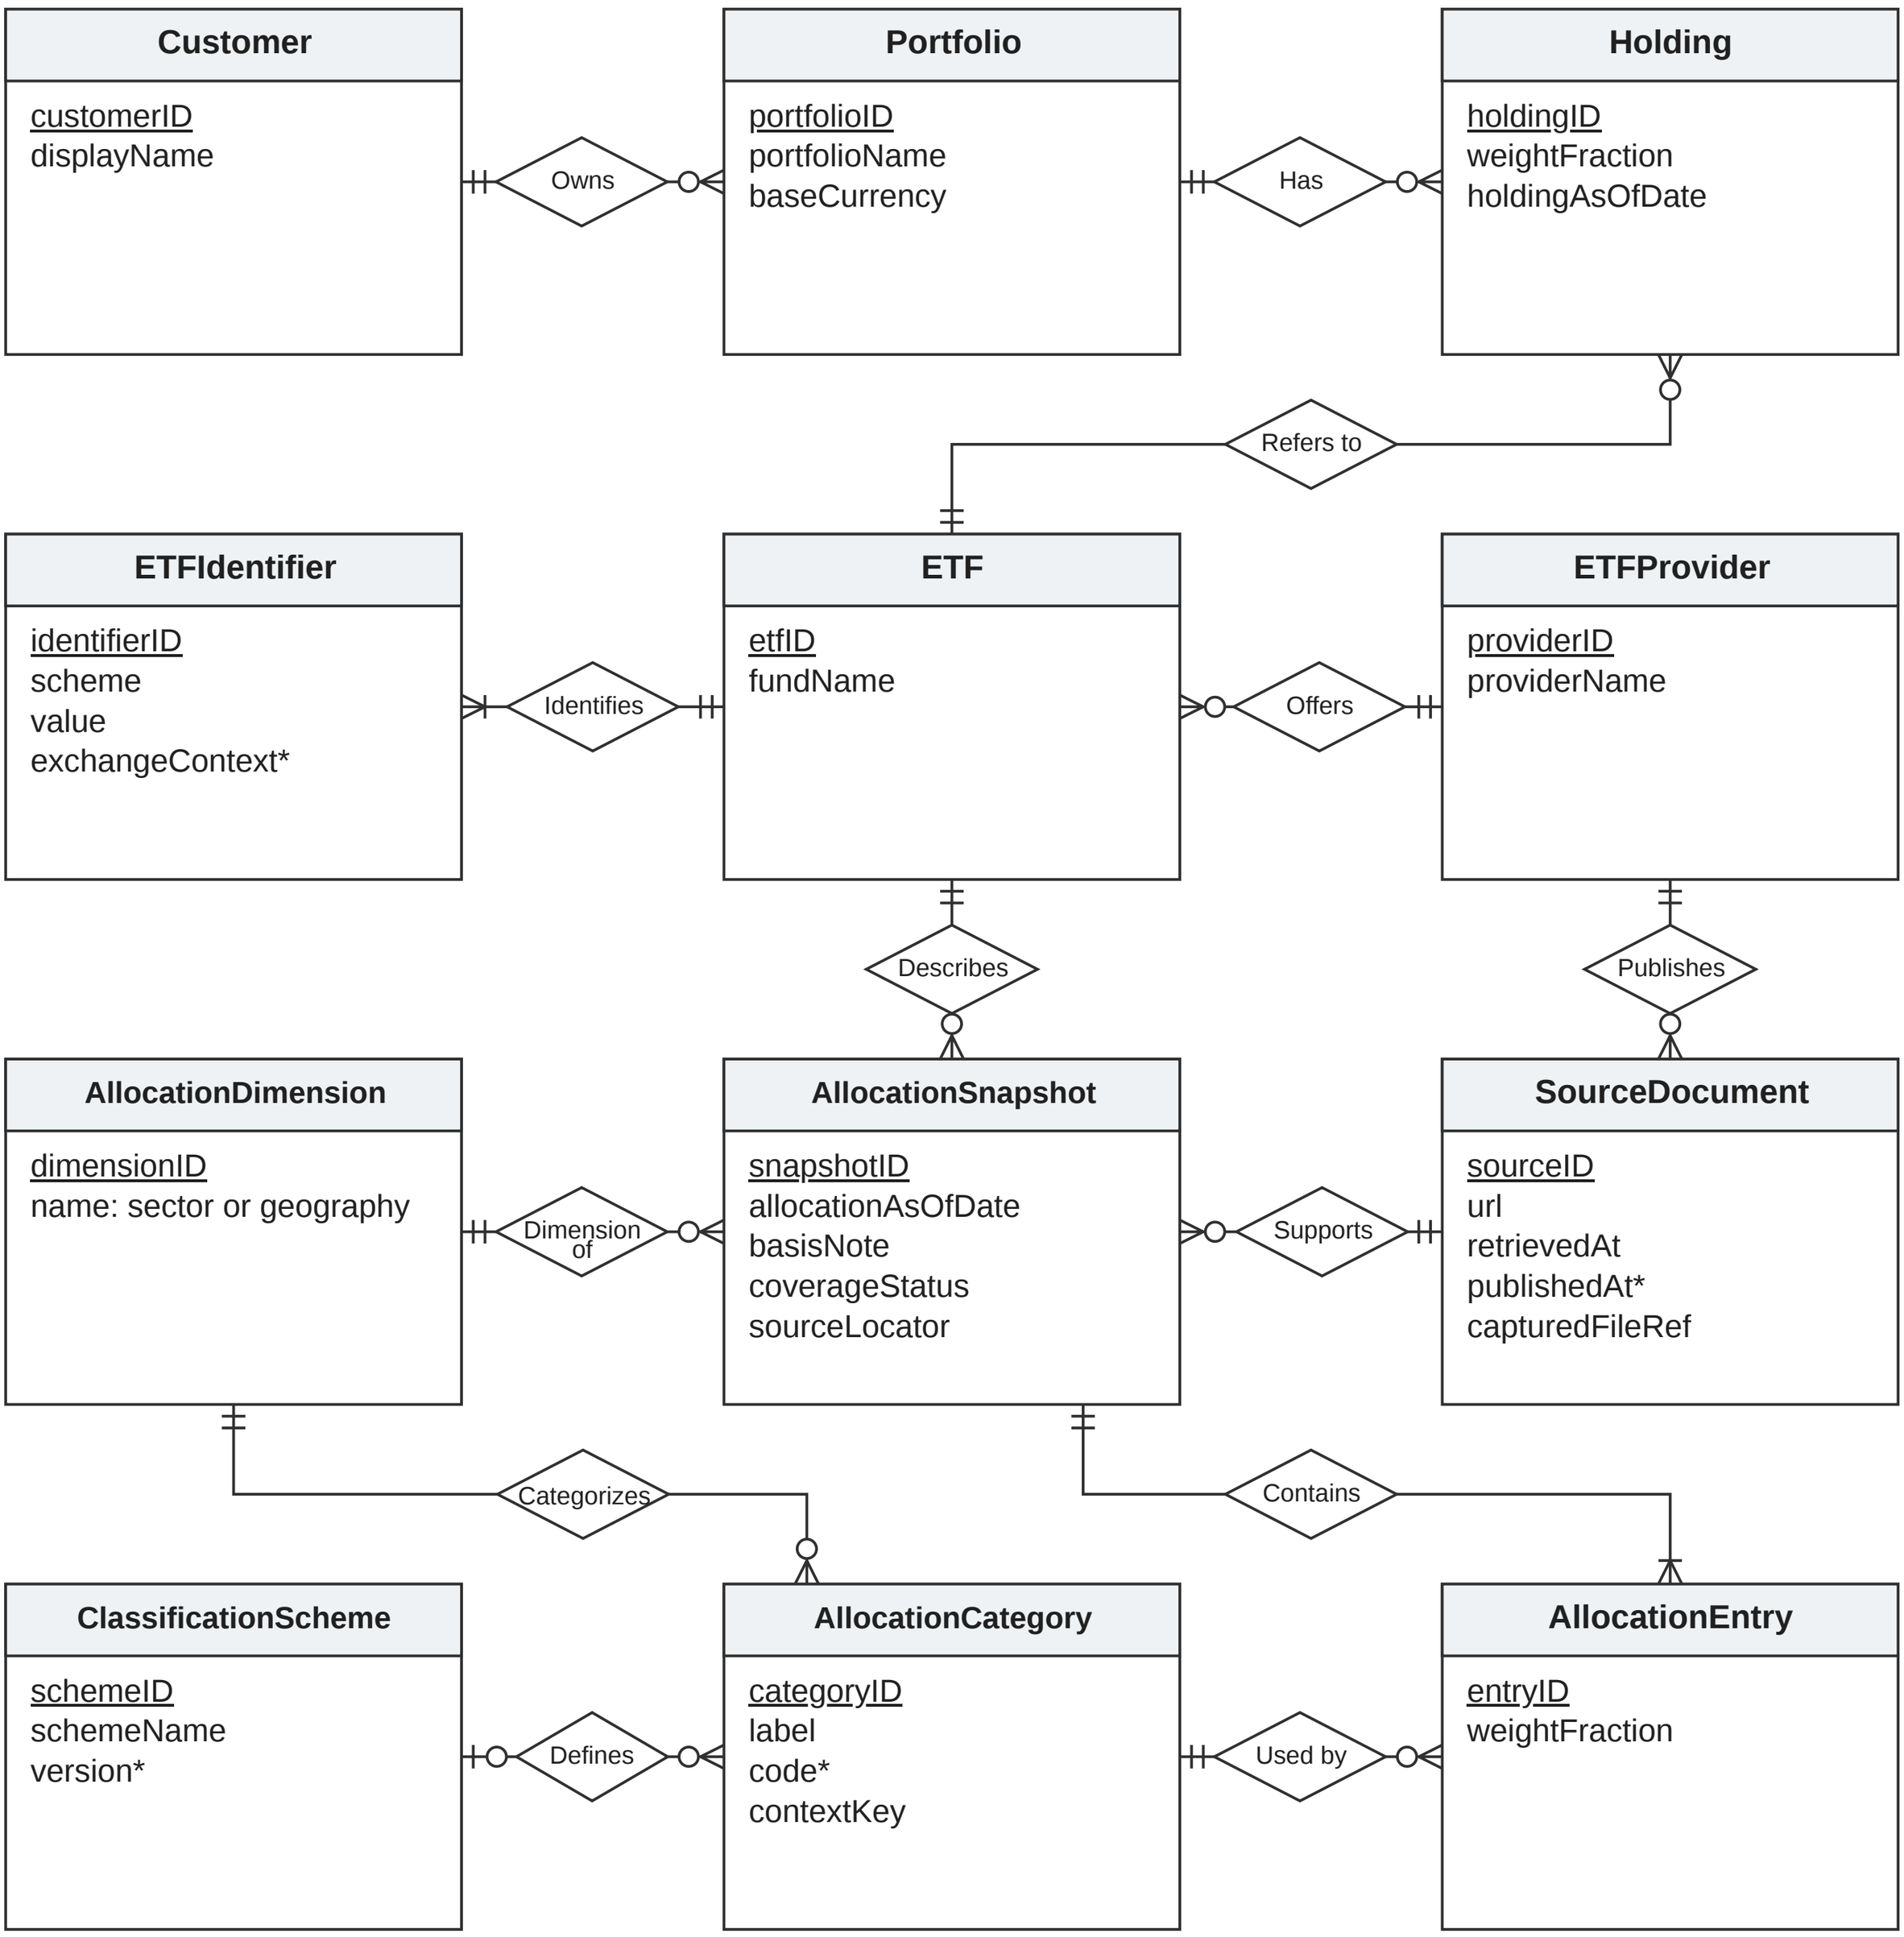
Dated ETF allocation disclosures

CSC501 Milestone 2 | Draft conceptual ER diagram | Lecture conventions

Compact attribute notation: W02B slide 30. Relationships use diamonds and crow’s-foot endpoints.



How to read the endpoints

Exactly one | Zero or one | One or more | Zero or more

Underlined attribute = selected identifying key. IDs are internal record identifiers, not foreign keys.

* = optional attribute. All other attributes are proposed recorded values; no SQL types are shown.

Each entry belongs to one snapshot and uses one category. Category and snapshot dimensions must agree.

Holdings and disclosures have separate dates. Sources denote captured versions, not changing URLs alone.

Unknown classification schemes remain unknown. Category labels alone do not establish equivalent meaning.

Assumptions: sole portfolio owner, one sampled ETF provider, one primary captured source per snapshot.
